BUILDING INFORMATION

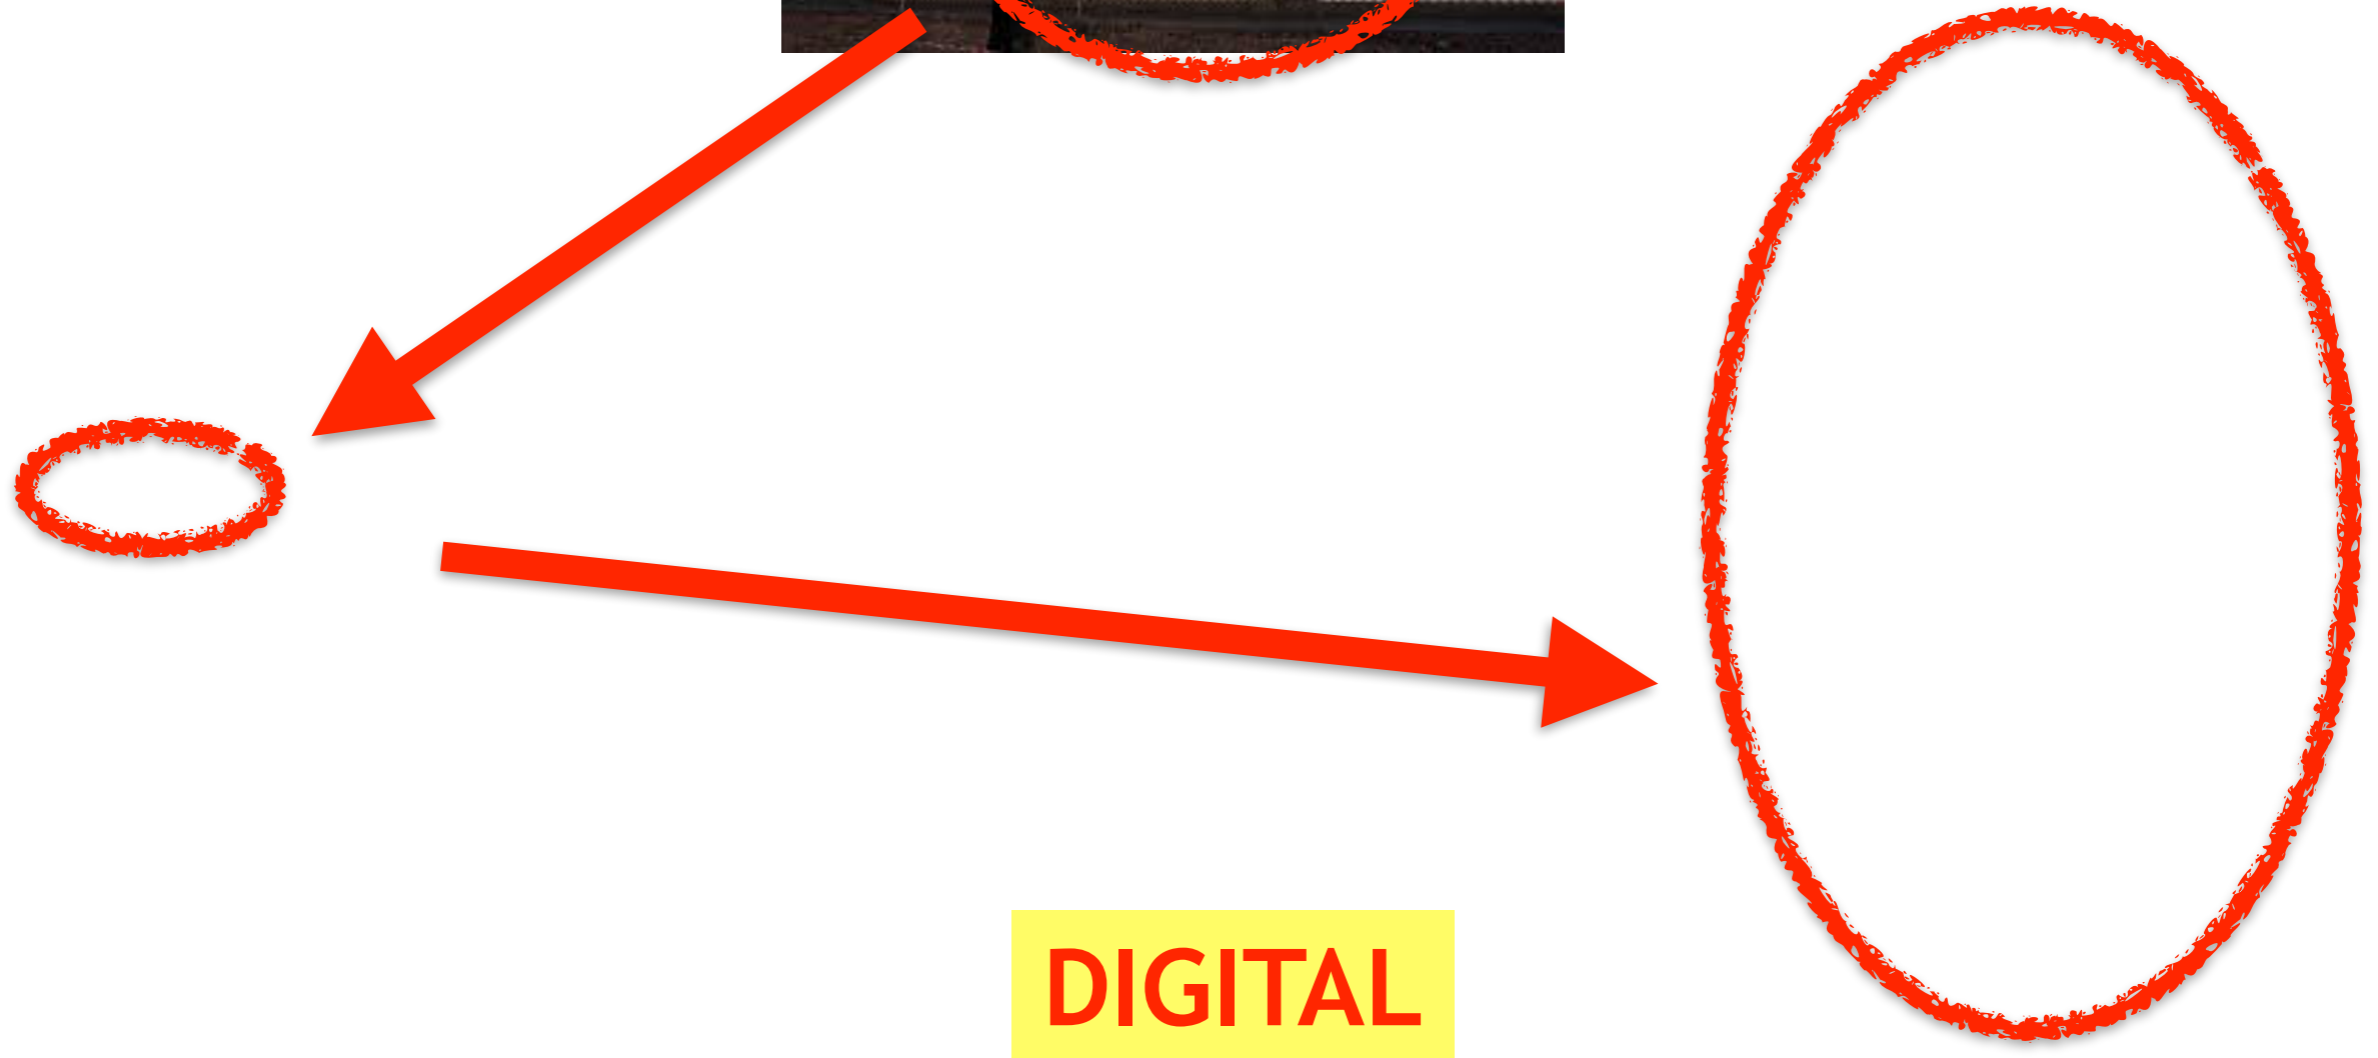

The image shows a screenshot of a spreadsheet application (Microsoft Excel) with a chart editor window open. The spreadsheet is titled 'KOSZTY_35_rysie2007-2011'. The chart editor window is titled 'Edytor wykresów' and shows a bar chart with the title 'Rozliczenie G67:G72'. The chart has a vertical axis ranging from 2,200.00 to 3,000.00. The spreadsheet data includes columns for dates, costs, and other metrics. A red circle highlights a cell in the spreadsheet, and a red arrow points from the chart editor to the highlighted cell. A yellow box with the word 'DIGITAL' is overlaid on the bottom of the spreadsheet.

BIM

- **BUILDING** Modelowanie informacji o obiekcie budowlanym
- **INFORMATION** **Poziom potrzeby informacyjnej -**
- **MODELLing** **Koncepcje i zasady**

ISO 7817

5.1 Framework to specify the level of information need

5.2 — consider purpose (WHY)

5.3 — consider information delivery milestone (WHEN)

5.4 — consider actors (WHO)

5.5 — consider objects (WHAT)

INFORMATION STRUCTURE

LEVEL of INFORMATION NEED - purpose

The purposes is specified to **clarify (WHY)** the information is needed. Level of Information Need for the purposes that is required for.

The level of information need does not specify the purposes. The same purpose, the geometrical information, alphanumerical information and documentation can vary for different objects.

For **accessibility analysis**, properties such as the clear opening width of a door, its location, the position and shape of the handle are needed.

Other properties, such as the name of the manufacturer and the acquisition cost, are not relevant to fulfil the purpose.

For **cost analysis** purpose, the acquisition cost of a door is needed, but the appearance of the handle is not relevant.

For **rendering** purpose, the geometrical appearance of a door is relevant, while the name of the manufacturer and the acquisition cost are not.

INFORMATION STRUCTURE

LEVEL of INFORMATION NEED - purpose

Purpose should not be explicit to all actors in some cases (security reasons). In those cases, the purpose should be considered as “not disclosed” and only authorized actors should be informed.

Purposes can be extracted from

(IOR) Organizational Information Requirements,

(PIR) Project Information Requirements

(AIR) Asset Information Requirements

as described in ISO 19650-1:2018, 5.2, 5.3, 5.4 and ISO 19650-2:2019

At information delivery milestone, the same Level of Information Need required for an object can be used for different purposes.

In concept design, the same geometry information of a block can be used for clash detection and for quantity take off.

INFORMATION STRUCTURE

LEVEL of INFORMATION NEED - delivery milestone

In specifying the Level of Information Need, information delivery milestones shall be considered.

The information delivery milestones (time axis) should be specified to **clarify (WHEN)** the information is needed.

The Level of Information Need does not specify the information delivery milestones.

At the same information delivery milestone, the geometrical, alphanumerical and documentation can vary for different objects.

For accessibility analysis, usually the same Level of Information Need is required at different milestones.

For energy analysis, different level of information need is required at different milestones.

INFORMATION STRUCTURE

LEVEL of INFORMATION NEED - actors

In specifying the Level of Information Need, **actors (WHO)** require and deliver the information shall be considered.

The Level of Information Need does not specify the actor(s).

The same Level of Information Need can be required by different actors at milestone to fulfil different purposes.

Different Level of Information Need can be required by different actors at milestone to fulfil the same purpose.

At different milestones, especially in the concept phase, the actor responsible to deliver specified Level of Information Need might not be specified.

INFORMATION STRUCTURE

LEVEL of INFORMATION NEED - actors

A client might ask for a specific Level of Information Need for an object at an agreed information delivery milestone without specifying who needs to deliver it. In this case supply chain is free to assign responsibilities as preferred.

Different actors are responsible for different Level of Information Need at the same information delivery milestone to fulfil the same purpose.

For design purposes, at agreed information delivery milestone, a wall in a project can be made up of a structural element, architectural cladding and air duct penetration with air duct passing through penetration. Mechanical, electrical and plumbing engineers are responsible to provide reliable information concerning sizing of duct and associated desired penetration sizing so that structural and architectural teams can continue to validate wall structure and cladding design.

INFORMATION STRUCTURE

LEVEL of INFORMATION NEED - objects

In specifying the Level of Information Need, the objects within a breakdown structure for the information delivery shall be considered.

The Level of Information Need does not specify the objects within a breakdown structure.

To specify the Level of Information Need, the considered objects within breakdown structure should be specified, identifying the semantic, functional and/or spatial decomposition of the project into objects (spaces and construction elements are identified) or any other breakdown structure.

INFORMATION STRUCTURE

LEVEL of INFORMATION NEED - objects

Based on the purpose, the Level of Information Need is **related to (WHAT)** :

- ◆ **Construction results** (spaces, construction complexes, construction entities and construction elements)
- ◆ **Construction information** (information model, building model, specification, documentation, diagram)

Breakdown structures can follow a classification system, systems engineering principles or a federation strategy.

Different purposes can require different breakdown structures and processed decompositions.

To fulfil the purpose of cost estimation during construction phase, breakdown structure can be different from breakdown structure required for scheduling.

ISO 7817

Terms and definitions

3.11 **information** = meaningful data

3.12 **geometrical information** = information expressed using geometry

3.10 **geometry** = shape, size, and location of an object

3.9 **object** = any part of the perceivable or conceivable world

3.13 **alphanumeric information** = information expressed using characters, digits and symbols or tokens

3.14 **documentation** = collection of documents related to a given subject

3.4 **information model** = set of structured and unstructured information containers

3.1 **information container** = named persistent set of information retrievable from within a file, system or application storage hierarchy

3.15 **information deliverable** = information container used to full-fill an appointment

DETAIL

- ★ an aspect describes the complexity of geometry compared to the real-world object
- ★ a continuum ranging from simplified to detailed
- ★ more refined geometric representations can contain more features, and/or be more decomposed, thereby being a better approximation of the shape of the real-world object

Detail of the door can be different, depending

- ◆ on the required purpose
- ◆ on information delivery milestones
- ◆ on appointing and appointed parties
- ◆ on objects within a breakdown structure

concept design simple detail of the door can be represented

(A) as **hole in the wall** to support structural analysis

standard design simple the door can be represented

(B) as **box** representing the door panel

for asset and facility management during operation

enhanced design detail adds the different components,

(C) as **threshold and casing** for clash detection

artistic and rendered design door can be represented

(D) as **handle and glazing** for visualization

DIMENSIONALITY

A number of spatial dimensions characterize the object:

zero-dimensional — 0D (location point)

one-dimensional — 1D (line, curve, path)

two-dimensional — 2D (surface, face)

three-dimensional — 3D (body, volume)

LOCATION

Location describes the position and orientation of an object.

Location is **absolute**,
against reference point,
absolute location of an object can be expressed
by its position and orientation in reference system
based on grids, alignment or reference point
(survey point in a coordinate reference system)

Location is **relative**,
relative location of an object against another object,
position and orientation in terms of topological relationships

APPEARANCE

Appearance describes the visual representation of an object.

- ★ a continuum ranging from symbolic to realistic compared to the real-world object.
- ★ more refined appearance can contain shading attributes (diffuse color, transparency, reflectance, emissivity), being a better approximation of the visual characteristic of the real world object.

PARAMETRIC BEHAVIOUR

describes whether or not the **shape, position and orientation** is created or to the context, into which the object is placed, allowing full or partial re

geometry types can allow parametric behaviors to a certain degree:

- **explicit geometry** – definition of shape as boundary representations (vertices, edges and faces) with no modification of the shape by other parameters
- **constructive geometry** – definition of shape as constructive solid geometry based on geometric primitives and swept solids that allow for modification of the shape by shape parameters;
- **parametric geometry** – definition of a singular shape or an assembly of shapes by equations that provide values for the shape parameters allowing for shape modifications based on object or context

object can be transferred as part of the **information delivery** or not.

in the context of information exchange,

parametric behavior can be **fully, partially or not requested.**

INFORMATION STRUCTURE

LEVEL of INFORMATION NEED - verification and validation

Concepts and principles of ISO 7817-2: 2023(E) standard allows the verification that specifying Level of Information Need has been fulfilled, conforming the prerequisites and its incorporation in the Exchange Information Requirements (EIR) and Information Delivery Plan (IDP).

Verification and validation can be performed when an information deliverable has been provided according to specified Level of Information Need, Exchange Information Requirements and its associated acceptance criteria. Level of Information Need should be specified in a way to allow both manual and machine interpretable verification and validation processes and/or schemas. Machine interpretable specification of Level of Information Need reduces time and human errors, when verifying and validating information deliverables.

Level of Information Need should be specified in a clear and unambiguous way to avoid any kind of different interpretation of the same requirement. Verification of information deliverables against the Level of Information Need can support checking the presence of objects (building, space, door), geometrical information (location, dimensionality), alphanumerical information (fire resistance, expected life, exposition class), documentation (building permit, manuals, warranties).

The verification of an information deliverable can check the presence of the fire resistance property for each object that requires such a check (fire door). Validation of information deliverables against the Level of Information Need ensures that the provided geometrical information, alphanumerical information and documentation can be used for the purpose they have been specified for.

The validation of an information deliverable can check that the value of the fire resistance property is a time based value or similar according to national legislations. Reliability and tolerance can be added to geometrical information, alphanumerical information and documentation. Completeness of verification criteria is included within ISO 19650-4:2022, term 7.6.

B I M

acronym

three different, but related functions

Official definition presented by
BuildingSMART International
January 31, 2012

DEFINICJE BIModell

is the DIGITAL REPRESENTATION of physical and functional characteristics of a facility.

As such it serves as a shared knowledge resource for **information** about a facility, forming a reliable basis for decisions during its life-cycle from inception onwards.

jest to CYFROWY OPIS fizycznych i funkcjonalnych właściwości budowli, służący jako źródło wiedzy i wszelkich **informacji budowlanych**, dostępny dla uczestników procesu inwestycyjnego i stanowiący niezawodną podstawę dla podejmowania decyzji w trakcie cyklu życia, od koncepcji do rozbiórki budynku.

DEFINICJE BIModelling

is a BUSINESS PROCESS for generating and leveraging building **data** to design, construct and operate the building during its lifecycle. BIM allows all stakeholders to have access to the same **information** at the same time through interoperability between technology platforms.

jest to PROCES TWÓRCZY generowania i wykorzystania **danych** o obiekcie budowlanym, jego projektowaniu, budowie i eksploatacji w trakcie pełnego cyklu życia. BIM pozwala, aby wszyscy zainteresowani uczestnicy inwestycji mieli dostęp do tych samych **informacji**, w tym samym czasie, przez interoperacyjność platform technologicznych.

DEFINICJE BIManagement

is the ORGANIZATION and CONTROL of the business process by the utilizing of information in the digital prototype to effect the sharing of information over the entire lifecycle of an asset. The benefits include centralized and visual communication, early exploration of options, sustainability, efficient design, integration of disciplines, site control, as built documentation, effectively developing an asset lifecycle process and model from conception to final retirement.

DEFINICJE BIManagement

jest to ORGANIZACJA i KONTROLA procesów inwestycyjnych poprzez wykorzystanie parametrów cyfrowego modelu budynku dla dokonywania wymiany informacji o składnikach aktywów w całym cyklu życia. Korzyści wynikają z scentralizowanej i wizualnej komunikacji poprzez obiekty trójwymiarowe, wczesnego rozpoznania możliwości, ze zrównoważonego i efektywnego, interdyscyplinarnego i interaktywnego projektowania, kontroli w trakcie i na miejscu budowy, aktualizacji dokumentacji do stanu rzeczywistego (zmiany projektowe, podczas budowy oraz w trakcie eksploatacji), efektywnego rozwoju aktywów i modelu cyfrowego w cyklu życia od koncepcji do rozbiórki budynku.
